Our Flagship System is the "Fingerprint Car Starter/Alarm" This amazing unit works on ANY car, truck, boat, or RV. Baround our exclusive technology known as "Live Fingerprint Identification" it uses the Four biological markers of pulse, blood pressure, body temperature, and living tissue, as well as our proprietary "3 Dimensional Scan Technology" to verify your fingerprint two ways. The ridges of the print itself, AND the DEPTH of the valleys BETWEEN the ridges. There are a few fingerprint ID systems available right now. But if you look at the description of how they work you will find out that everything available as well as everything in developement are nothing more that "Image Scanners". Will they identify a fingerprint? Yes. Much like the print ID system used by law enforcement. The biggest flaw in this type of system is that it can be circumvented with an IMAGE of a print or a reverse wax impression (just like in the movies). Not very secure is it? These companies mis-lead consumers by labeling their products as "Biometric Optical Identification". Sounds impressive, and the word "Optical" is accurate. Some simply use the word "Biometric". Technically speaking, your fingerprint is a biological marker. But the bottom line is this: they do nothing more than simply scan a one dimensional image that is then stored in it's limited capacity data base for comparison. They are NOT "True Live Biometrics" by any stretch of the imagination. Our unit also has "function-expandable characteristics" that can be upgraded and conformed to your specific needs, while the others only have one function, the START function. This leaves no room for expansion and no product flexibility to extend the functions or to tap into future upgrades.

Our systems "out-of-the box" features include "anti car-jacking function" / "set multiple users for fleet management applications" / " setting the fingerprint authorization time limits" (which is ideal for rental applications. Or someone who wants to make sure their teenage driver comes home at the designated time on Friday night) and a host of other parameter modification functions. Upgrades are currently in development and include a facial recognition system, car accident black-box system, and a remote starter system.

We also offer a system for your home or office computer. Our USB Encrypted Fingerprint Mouse. It eliminates hackable passwords on your Windows base PC. Not only does it replace the weak windows log-on security, but it allows you to encrypt sensitive files on the fly. You can also encrypt entire folders. Without an authorized users Fingerprint your files as well as your entire system are safe from intrusion. The reality is passwords can be hacked or even guessed at. But with the Fingerprint Mouse you can rest easy knowing your system is safe. And you'll LOVE the silky smooth, accurate functionality of this little gem.

And finally, if you ever have to transport sensitive data from office to office, or office to home and back again, we offer our USB Encrypted Fingerprint Flash Drive. If your drive is ever lost or stolen your data may be lost\* but you can be certain that NO ONE ELSE will be able to access the drive and use the information. With identity theft on the rise this is a prime concern. For more detailed information on our Flash Drives, see the associated document "Flash\_Security".

(\*note: sensitive or crucial data should be backed-up regularly, but especially before transport)

All our products are available for immediate delivery and volume pricing is available. Visit our website or call for details.
